

IN THE CLAIMS:

The text of all pending claims, (including withdrawn claims) is set forth below. Cancelled and not entered claims are indicated with claim number and status only. The claims as listed below show added text with underlining and deleted text with ~~strikethrough~~. The status of each claim is indicated with one of (original), (currently amended), (cancelled), (withdrawn), (new), (previously presented), or (not entered).

Please AMEND claims 1, 3, 4, and 13, as follows.

1. (CURRENTLY AMENDED) An apparatus for controlling the power of a monitor, comprising:

a computer selectively outputting a predetermined signal when the computer is powered on ~~or~~ and off;

a monitor ~~receiving to receive~~ the predetermined signal and selectively performing powering on ~~or~~ and off of the monitor according to the predetermined signal; and

a video card processing and transmitting a video signal to the monitor;

wherein the predetermined signal output from the computer is output from a predetermined pin of the video card,

wherein the predetermined signal is transmitted to the monitor, ~~regardless~~ independent of whether the monitor is powered on and independent of whether the monitor is powered ~~or~~ off, and

wherein, if when the monitor is powered off, a memory of the monitor is powered by the predetermined signal to provide the computer access to monitor information stored in the memory.

2. (CANCELED)

3. (CURRENTLY AMENDED) An apparatus for controlling the power of a monitor, comprising:

a computer selectively outputting a predetermined signal when the computer is powered on ~~or~~ and off;

a monitor ~~receiving to receive~~ the predetermined signal and selectively performing powering on ~~or~~ and off of the monitor according to the predetermined signal; and

a video card processing and transmitting a video signal to the monitor;

wherein the predetermined signal output from the computer is output from a predetermined pin of the video card; and

wherein the predetermined signal is transmitted to the monitor, ~~regardless independent~~ of whether the monitor is powered on and independent of whether the monitor is powered on or off, so that monitor information in the monitor is readable-accessible by the computer based upon the transmission of the predetermined signal, wherein the monitor comprises:

a memory storing the monitor information, wherein the monitor information is ~~provided accessible to-by~~ the computer, ~~regardless-independent~~ of whether the monitor is powered on and independent of whether the monitor is powered on or off, based upon the transmission of the predetermined signal;

a control unit comparing a reference level with a level of the predetermined signal, detecting a state of power of the computer based on a result of the comparison, and outputting a monitor power control signal; and

a power supply unit to selectively perform -supplying ~~or-and~~ cutting off power to the monitor in accordance with the monitor power control signal output from the control unit.

4. (CURRENTLY AMENDED) The apparatus of claim 3, wherein the predetermined signal drives the memory so that the monitor information stored in the memory is ~~read~~accessible by the computer.

5. (PREVIOUSLY PRESENTED) The apparatus of claim 3, wherein the control unit outputs a first control signal to supply power to the monitor in response to the level of the predetermined signal being higher than the reference level, and the control unit outputs a second control signal to cut off power to the monitor in response to the level of the predetermined signal being lower than the reference level.

6. (PREVIOUSLY PRESENTED) The apparatus of claim 5, wherein the level of the predetermined signal is 5V in response to the computer being powered on, and 0V in response to the computer being powered off.

7. (PREVIOUSLY PRESENTED) The apparatus of claim 1, further comprising a serial cable, wherein the predetermined signal is transmitted from the computer to the monitor via the serial cable.

8-12. (CANCELED)

13. (CURRENTLY AMENDED) A method of controlling the power of a monitor, the method comprising:

receiving a predetermined signal from a computer ~~when based upon~~ the computer is being powered on or off; and

selectively powering the monitor on and off according to the predetermined signal, wherein the predetermined signal is transmitted to the monitor ~~regardless independent of~~ whether the monitor is powered on and independent of whether the monitor is powered or off, and

wherein the receiving of the predetermined signal includes supplying power from the predetermined signal to a memory in the monitor storing monitor information, so that the monitor information in the memory is ~~readable accessible~~ by the computer based upon the predetermined signal if when the monitor is powered off.

14. (CANCELED)

15. (PREVIOUSLY PRESENTED) The method of claim 13, wherein the powering on and off of the monitor further comprises:

detecting a level of the received predetermined signal;

supplying power to the monitor in response to the level of the predetermined signal being higher than a reference level; and

cutting off power to the monitor in response to the level of the predetermined signal being lower than the reference level.

16-23. (CANCELED)
